

EJECTION APPARATUS AND METHOD

ABSTRACT OF THE DISCLOSURE

5 Various embodiments of an ejection apparatus and methods are provided.
In one representative embodiment an ejection apparatus includes a bar movable
along a first axis and a carriage movable along a second axis which is distinct from
the first axis. The bar which has an edge oriented along an angular position
between the first axis and the second axis, is in physical communication with the
10 carriage such that movement of the bar along the first axis causes movement of the
carriage along the second axis.
